

Upgrade Path & Processes

The FireMon Asset Manager upgrade package upgrades the Command Center and Scout.

This upgrade will preserve your current configuration for users, roles, organizations, zones, collectors, Scouts, and system connections. The FIPS state (i.e., enabled or disabled) any changes you've made to the Martian packet logging in `vi/etc/sysctl.conf` file are maintained during the upgrade. Orphaned attributes (those not associated with any device) and all certificates are cleaned off of the Asset Manager database upon upgrade. Custom queries, dashboards, and reports carry through from one release to the next.

Upgrade packages are available for download in the [FireMon User Center](#), on the **Downloads** page.

If you are upgrading from FireMon Asset Manager 4.7 to 4.8, previous branding customizations will be reapplied. However, previous branding customizations will not be reapplied if you are upgrading to Asset Manager 4.7. Please contact support@firemon.com for instructions on how to rebrand after upgrading.

Get Ready

1. [Check prerequisites](#)
2. Review [Release Notes](#)
3. Back up your system
 - a. [Export Configuration](#)
 - b. [Export Custom Dashboards & Reports](#)
 - c. [Export Custom Device Profile Patterns](#)
4. Follow the Upgrade Path & Process
5. Validate the upgrade
 - a. [Check version & configuration](#)
 - b. [Enable Collectors](#)
