Collector Change Log

In response to customer interest in knowing what changes users have made to collectors, we are providing a new advanced query, which itemizes those changes.

The Query

```
select ena.id as "Id", ena.type as "Notification Type", ena.message as "Message", ena.details as "Details", zz.
name as "Zone Name" from events as ena join zone as zz on zz.id=ena.zone_id where type like '%COLLECTOR%'::STRING
and time < current_timestamp order by time desc
```

What It Does

This queries against a table of all subscribed and unsubscribed events.

Sample Output
